

2. CASUS Annual Workshop

“Fusing Artificial Intelligence & Simulation”

“Mining observations and climate models for detecting and attributing anthropogenic climate change in the world’s water cycle”

Lukas Gudmundsson, Eidgenössische Technische Hochschule Zürich

Date: 7 October 2020

Time: 5 p.m. CEST

Location: livestream link follows

Abstract:

One of the key concerns with anthropogenic climate change are its effects on the terrestrial water cycle. Model projections indicate that anthropogenic climate change can affect regional water availability and may trigger more floods and droughts. While there is mounting evidence showing human impacts in the atmospheric part of the water cycle, the limited availability of relevant observations has so far prevented an unambiguous detection and attribution of anthropogenic climate change in terrestrial water resources and hydrological extremes. Recent advances in mobilizing in situ observations around the globe and breakthroughs in data-driven reconstructions of essential freshwater variables using machine learning allow now for an unprecedented assessment of global hydrological change. Causal drivers of observed change are investigated using climate change detection and attribution methods, that ingest both observational information and model based evidence. The analysis allows to conclude that it is very likely that anthropogenic climate change is already impacting water resources and hydrological extremes at the global scale.

SYSTEMS UNDERSTANDING

Biography:

Lukas Gudmundsson is a climate scientist with a special interest in global freshwater dynamics. After finalizing his PhD on large-scale hydrology and the University of Oslo (Norway), he moved to the Institute of Atmospheric and Climate Science, ETH Zurich (Switzerland), where he now works as senior scientist, lecturer and daily advisor of graduate students. He has published over 50 peer reviewed articles (eight in Nature journals). In his recent work, Lukas Gudmundsson uses machine learning to reconstruct global dynamics of water availability and explores fingerprints of anthropogenic climate change in freshwater resources and hydrological extremes.
